# **ENERGY, OIL AND NATURAL GAS**

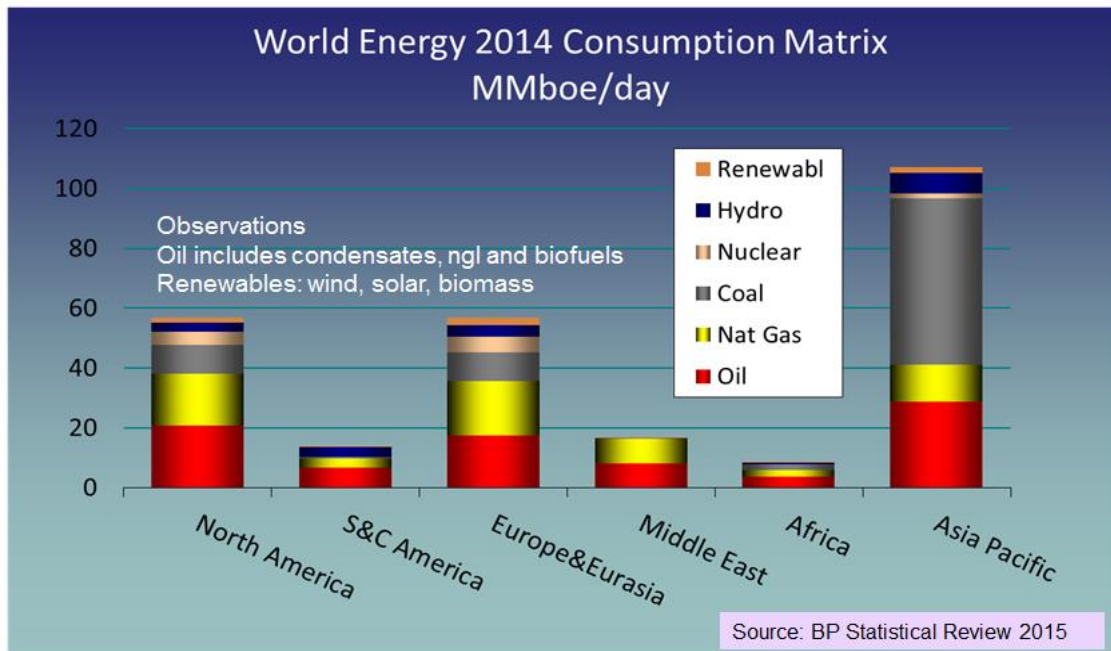

## **Past Trends in Supply and Demand**

The world's energy matrix has been predominately based on fossil fuels since the industrial revolution.

Coal remained as the single most important source of energy until the early part of the 20th century. By the 1950's oil had displaced coal as the largest component of the energy matrix and remained so since then. At the same time natural gas substantially increased its participation in the energy mix, particularly in the more industrialized and developed countries.

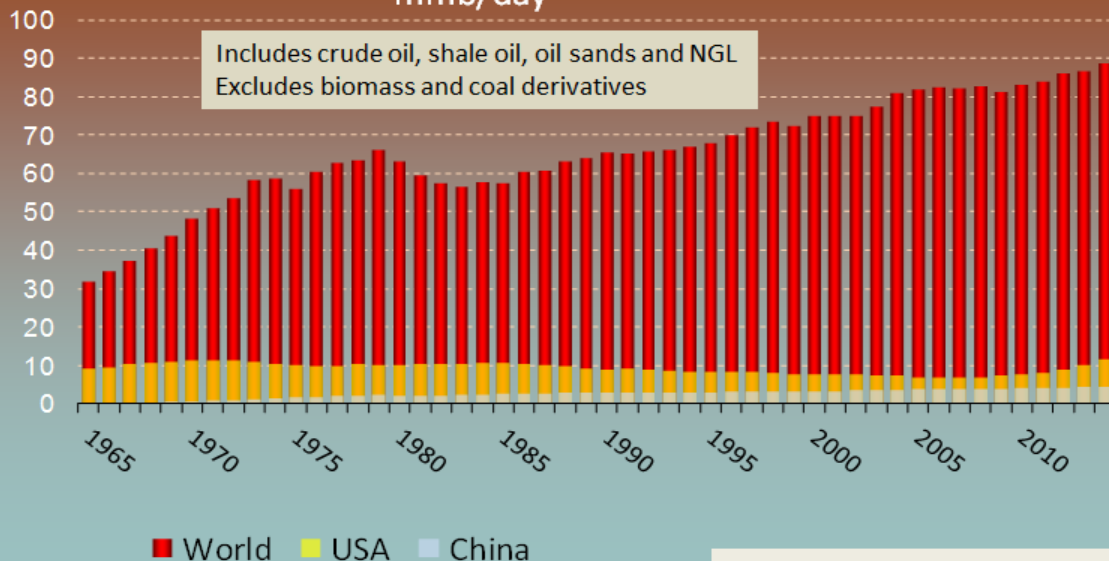

Today's energy mix still relies mostly on fossil fuels (86%), with oil and natural gas accounting for 56% of the overall energy consumption. Increasingly, environmental, social and economic factors indicate that, to be sustainable, the future matrix will have to be de-carbonized, more efficient, and rely a lot more on renewable, clean and socially acceptable sources of energy. A transition into this new model will require massive technology, capital, infrastructure development/adaptation and changes in consuming habits.

Global oil demand, and supply, has steadily increased during the last 50 years except for brief periods following the 1970s and 1980s oil price shocks and the severe global recession of 2008.

It is interesting to note that the USA and China, currently the largest consumers, followed different production vs consumption trends in the last 10yrs. The USA production has been steadily growing at the rate of 6% y/y while the consumption has slightly declined. On the other hand, China's production has moderately increased (1.7% y/y) while its consumption continued growing at a faster pace (5.5% Y/Y).

## Main Oil Producing and Consuming Countries, 2014.

Global natural gas demand and supply also grew at a steady (and faster) pace during the last 50 years. Demand growth was in general more resilient than in the oil case, with only one year on year decrease following the 2008 recession.

In the last 10 years both demand and production grew in the USA (about 2.2% and 4% y/y, respectively) and China (about 16% and 11% y/y, respectively). Russia, for several years the largest producer, and consistently the second largest consumer after the USA, had both production and consumption approximately constant during this period.

# **OIL AND NATURAL GAS RESERVES AND RESOURCES Past Evolution and Current Situation**

Since the middle of the 19<sup>th</sup> century the industry has managed to meet the world's oil demand, except for brief disruptions caused by war or natural disasters, while at the same time continuously increasing the available resource base.

By the year 2000, the world had consumed its first trillion barrels of oil. Only 14 years later, another 440 billion bo were consumed. Meanwhile the reserve base was not only fully replenished but increased by 450 bbo, to 1,700 bbo. Which implies that for every barrel of oil consumed about 2 new barrels were added to the reserve base.

Furthermore, basin analyses performed by various industry and academic entities identified potential global oil resources that could duplicate the current proved reserves.

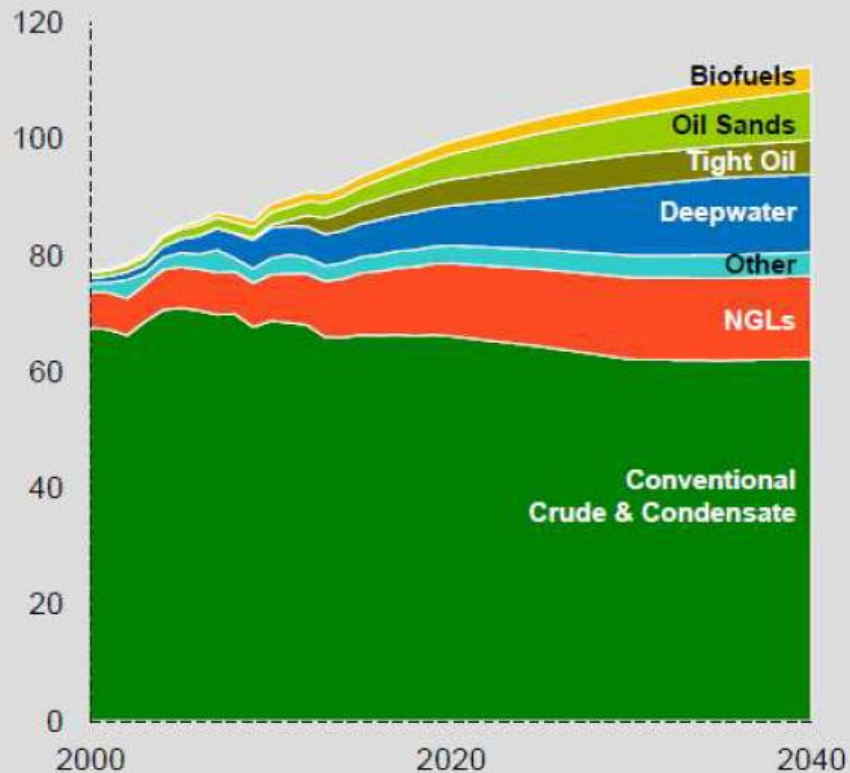

An analogous situation occurs with respect to natural gas since the early part of the 20th century. While demand, and supply, steadily grew to current levels, the available resource base has also grown in the same pace. By the year 2000, the world had consumed over 2,300 tcf of natural gas and, only 14 years later, almost 1,500 tcf were additionally used. Meanwhile the reserve base was not only fully replenished but increased by almost 1,900 tcf, to 6,606 tcf, which implies a replenishment rate of approximately 2.25cf per cf consumed. Also similarly to the oil situation, huge potential resources, particularly of non conventional shale and tight sand gas, were identified that can more than double the current proved reserves.

# **FUTURE CONSUMPTION PROJECTIONS**

## **Capital Requirement to Meet Demand**

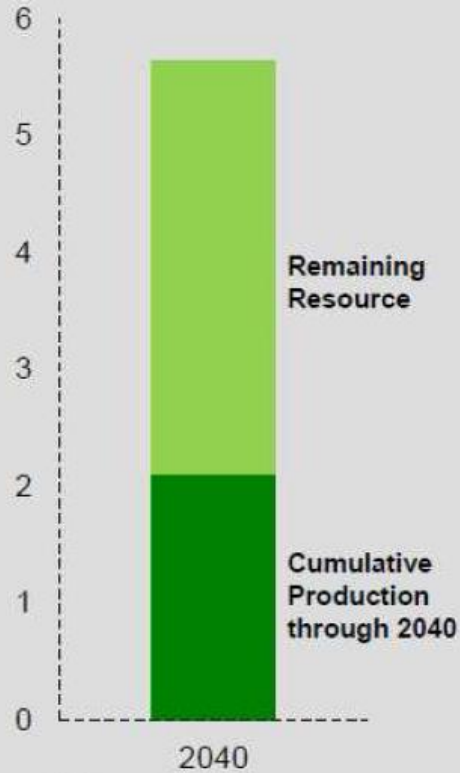

### Liquid Supply by Type

MBDOE

### Crude and Condensate Resource\*

Trillion barrels of oil

\* Source: IEA

ExxonMobil 2014 Outlook for Energy

**ExxonMobil**

Projections of future demand of oil and liquid fuels by BP, Exxon and the EIA, are fairly different with respect to the growth rate, ranging from 0.4% to 0.9% per year. Nevertheless all point out to a steady growth in demand albeit at a low pace. Conversely, projections by Exxon and BP are almost coincident with respect to future demand of natural gas, expected to continue growing at a rate of approximately 1.85% per year.

### Total Oil & Liquids Consumption Past & Future Projections MMbo/day

### Total Natural Gas Consumption Past & Future Projections TCF/year

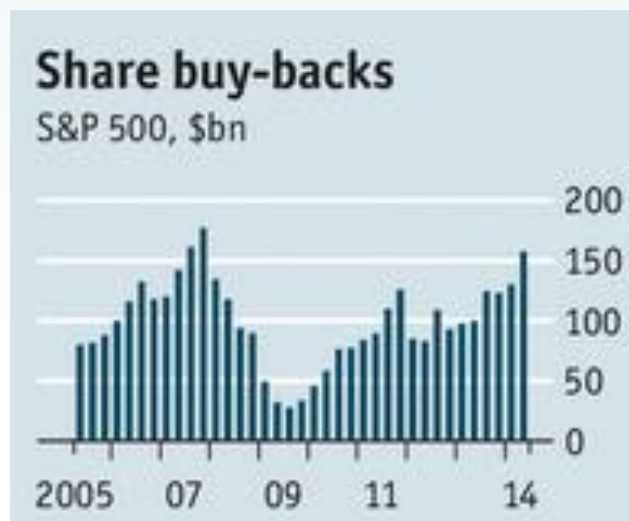

Given the natural depletion of the currently producing oil and gas reservoirs it is clear that, even if a modest 2.5% depletion rate is assumed, very significant new production will have to be brought onstream to meet demand. In the scenarios outlined in the graphs about 60 mmbd/day and 120TCF/year of new production will be necessary by 2040. This new oil and natural gas will initially be sourced in the existing fields (enhanced recovery, infill drilling) and producing provinces, but progressively will require the discovery and development of resources in new provinces, which will be increasingly more geologically risky, expensive and challenging from the operational and environmental perspectives. Massive amounts of capital will be required to continue meeting the demand, estimated at around \$1trillion per year by the IEA.

According to IEA's estimates more than \$40tn will need to be invested in energy supply until 2035, approximately \$2tn per year over the next 20 years (Maria van de Hoeven, World Energy Outlook 2014) to meet the global energy demand. At least half of this will have to be allocated to the oil and gas sector if the above demand projections are to be met.

There is plenty of capital in the world seeking investment opportunities with sufficiently attractive rates of return. To illustrate the point, The Economist points out in their Sep13th, 2014 issue (Figure 6) the record amounts of share buy-backs (over \$ 150bn so far this year by S&P 500 companies), the main reason being that these companies are not finding enough investment opportunities with return meeting shareholder's expectations.

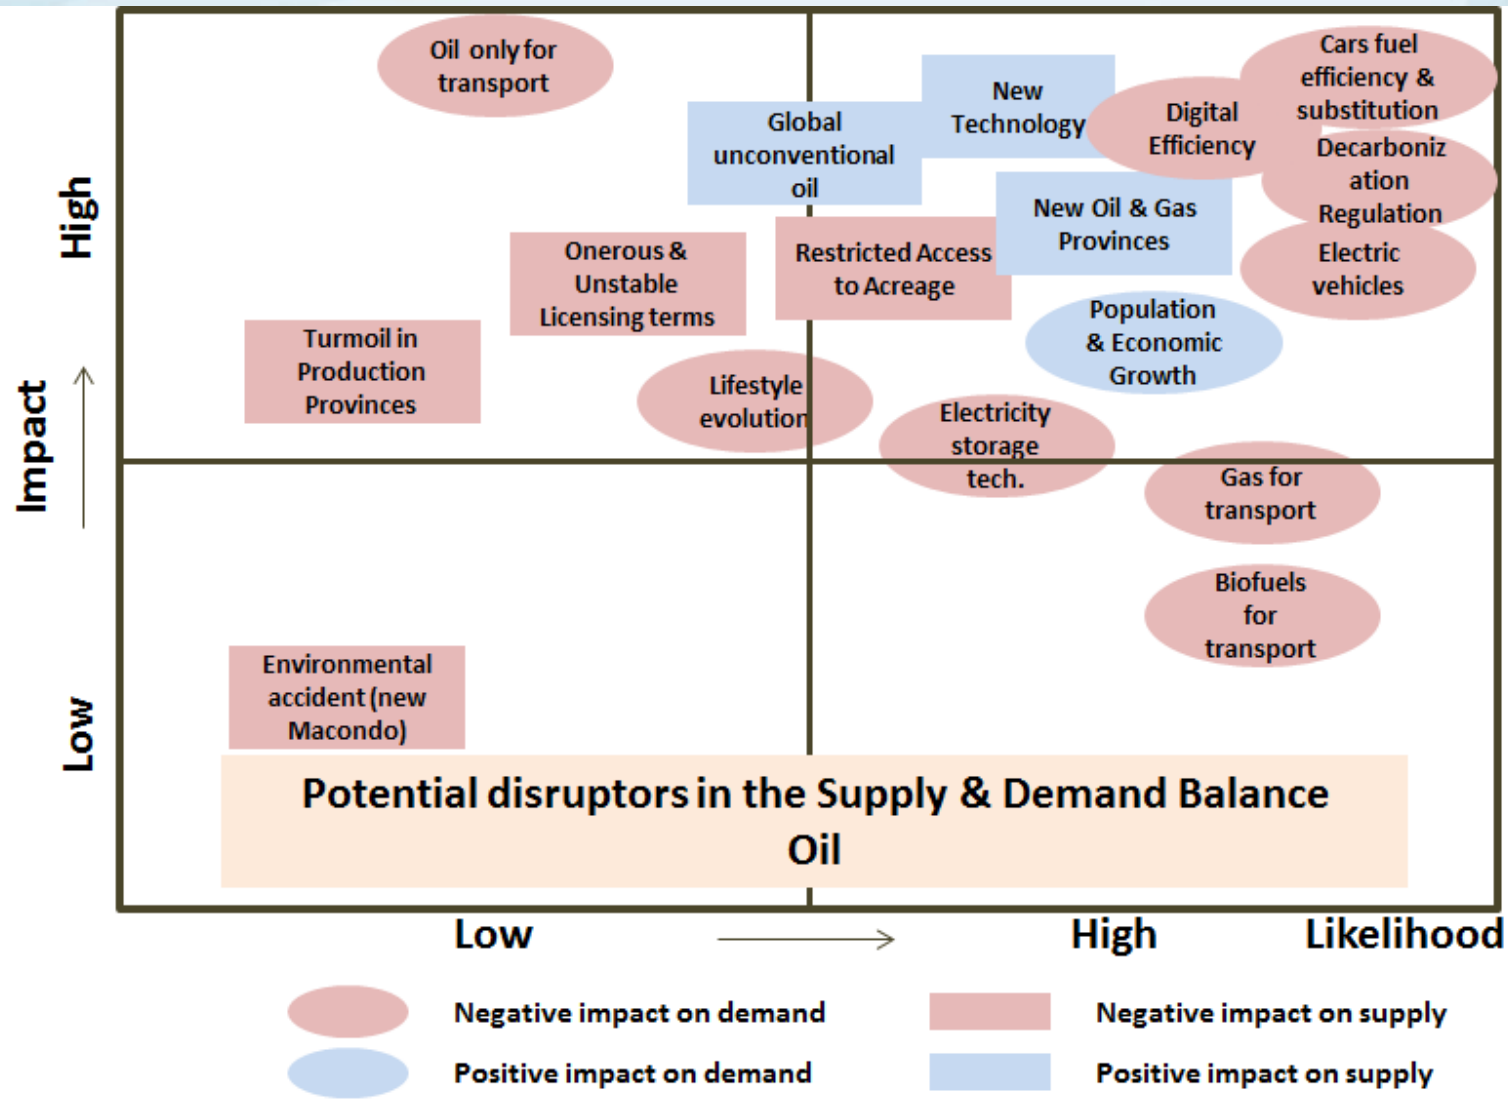

# **FUTURE SUPPLY & DEMAND BALANCE**

## **Potential Disruptions and Uncertainties**

Potential disruptions in the supply & demand balance of oil are mostly driven population growth and economic development, new technological developments on both production and consumption, and regulatory restrictions to carbon emissions.

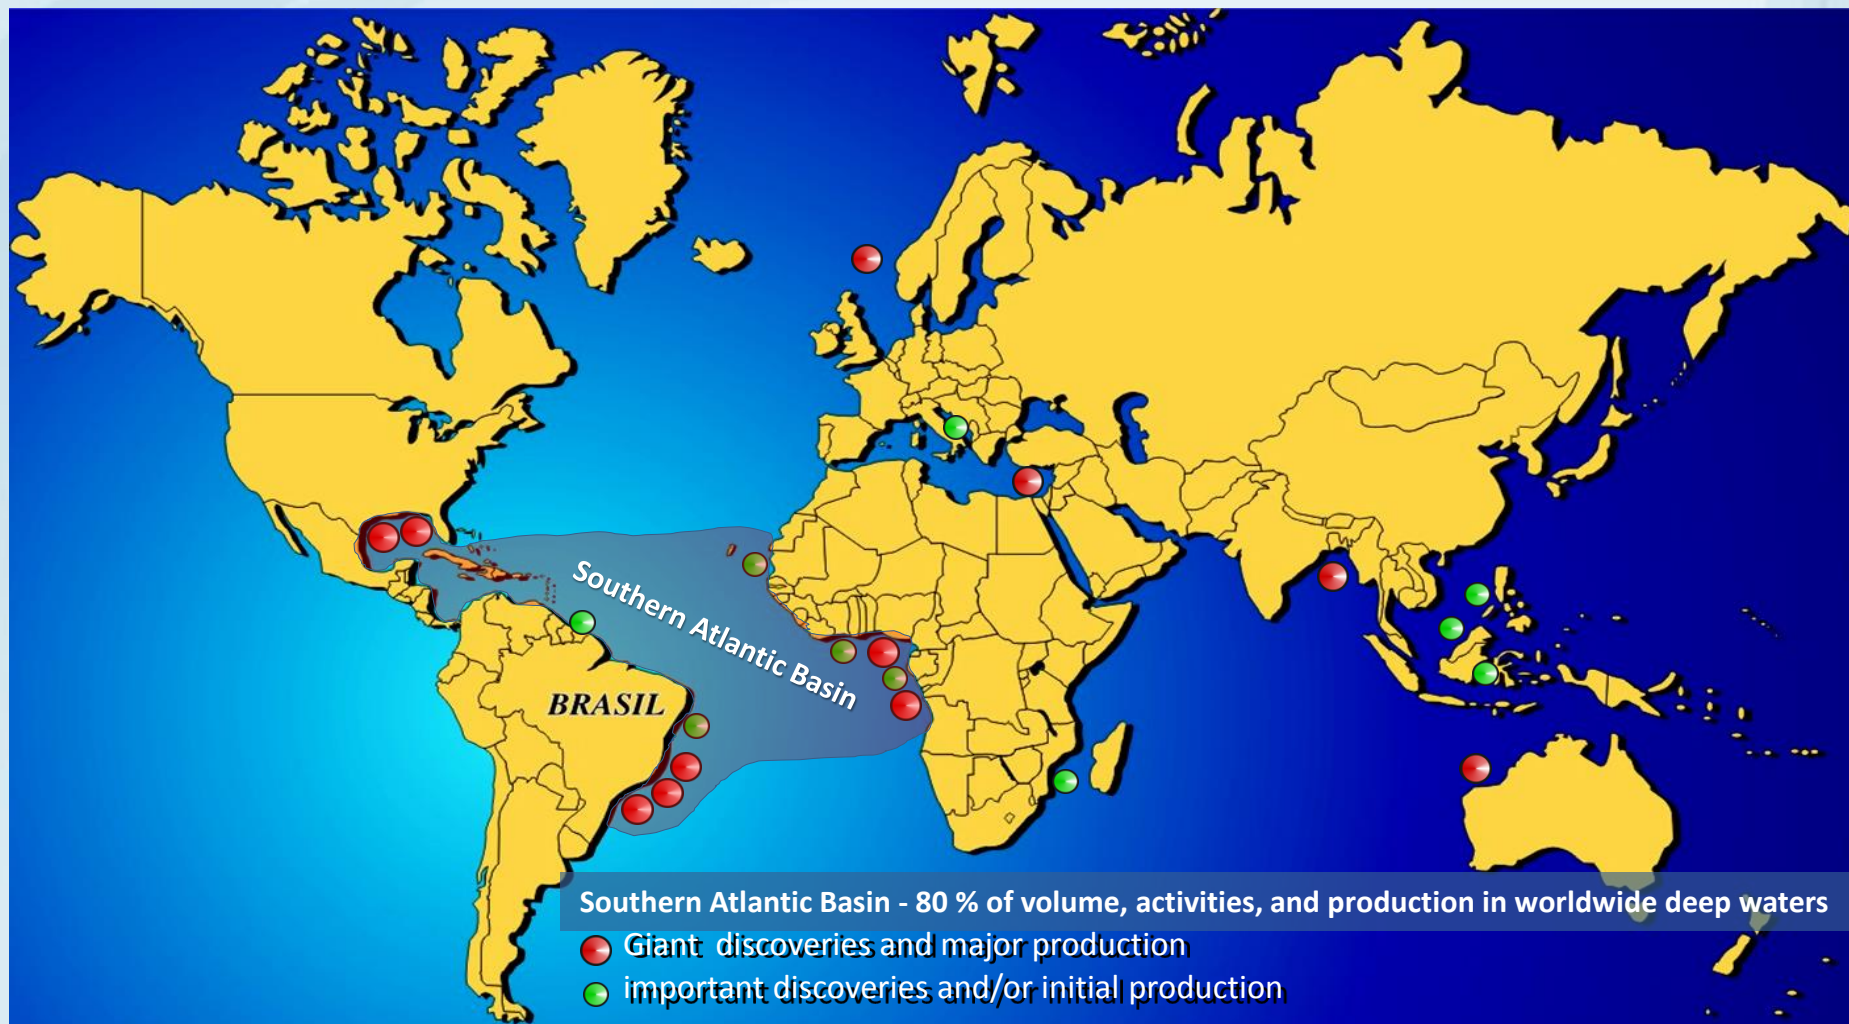

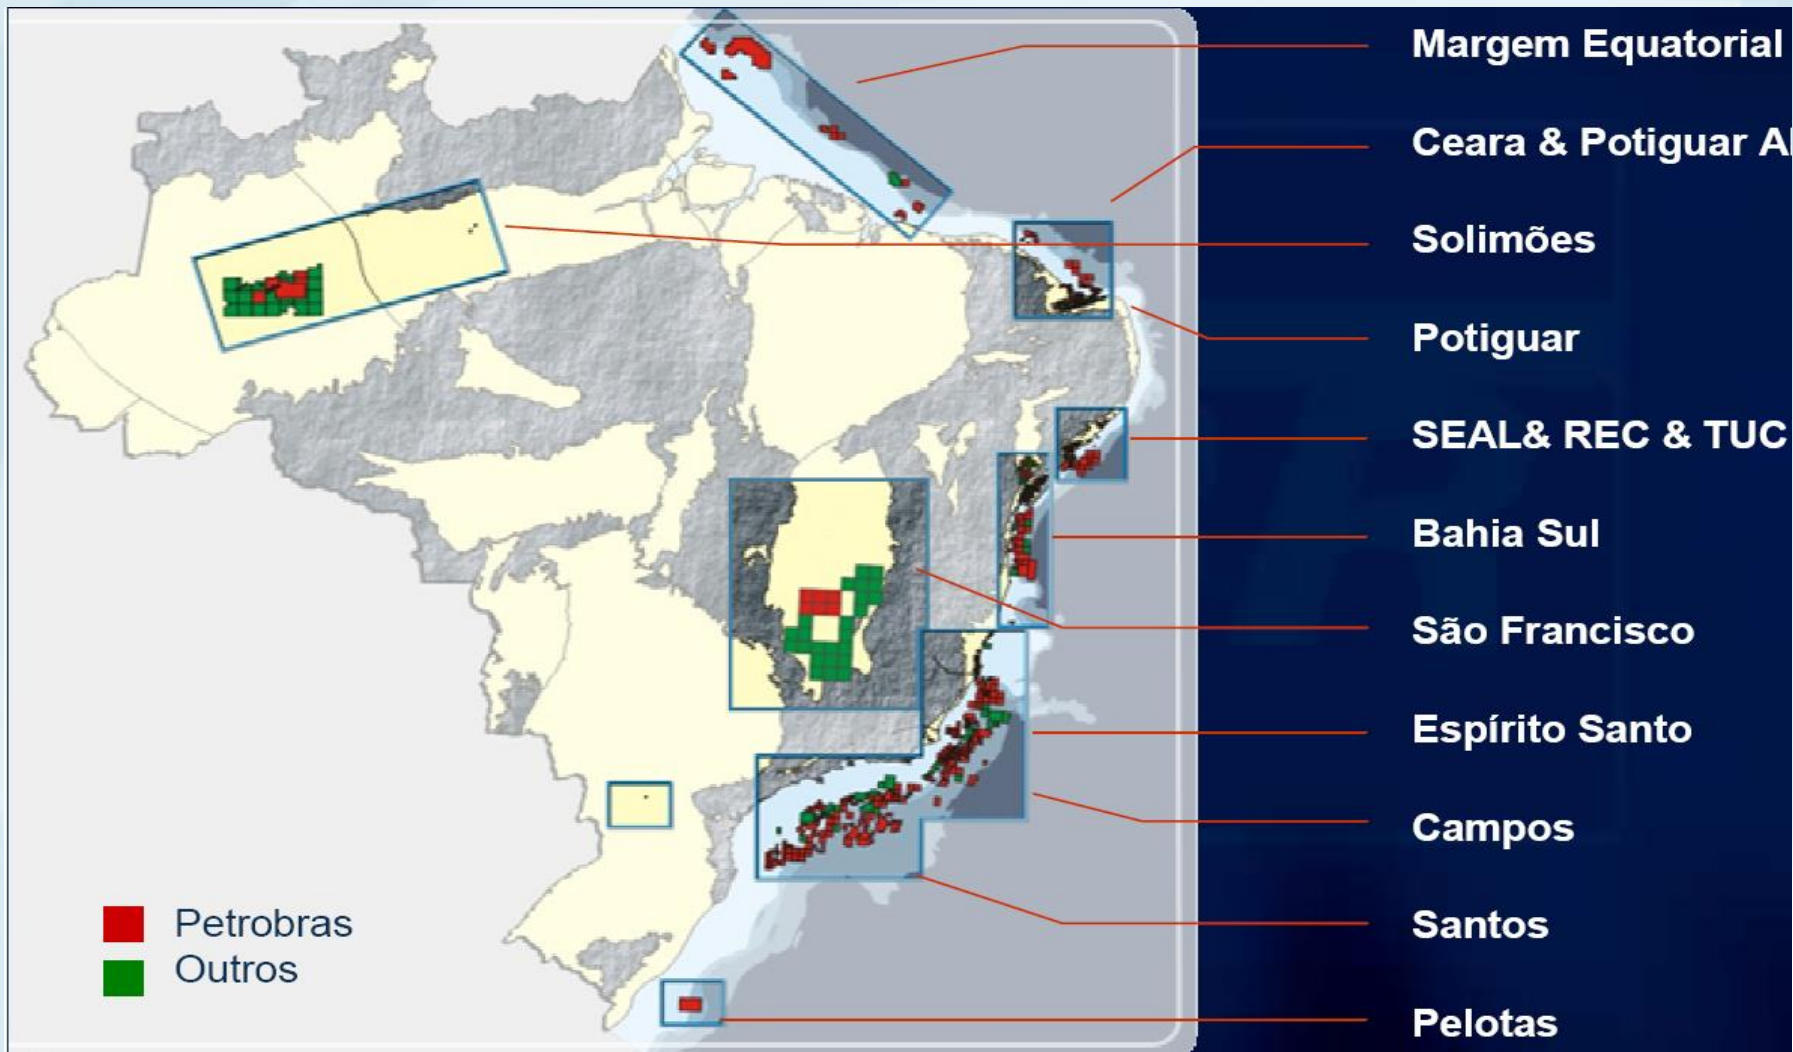

On balance the potential disruptions to oil supply and demand seem to be skewed towards slower consumption growth (driven by technology, fuel efficiency and environmental restrictions). On the supply side it is expected that productivity will increase from both existing and new oil provinces, as long as restrictions to E&P investment are removed/mitigated.

*Barra's Position Offers Exposure to Both the Pre- and Post-salt with a Significant Prospect Inventory*

## Fifteen Largest Pre-Salt Individual Well Production (Jan/15)

## **Pre-Salt Development Challenges**

- Wells Drilling = thick salt column & high pressure
- Logistics = up to 300km offshore
- New materials = presence of CO<sub>2</sub>
- Natural gas gathering = pipeline or FLNG?
- Local content = Engineering & equipment
- Financial= Investments and operational expenses in the order of US\$ 1,0 trillion

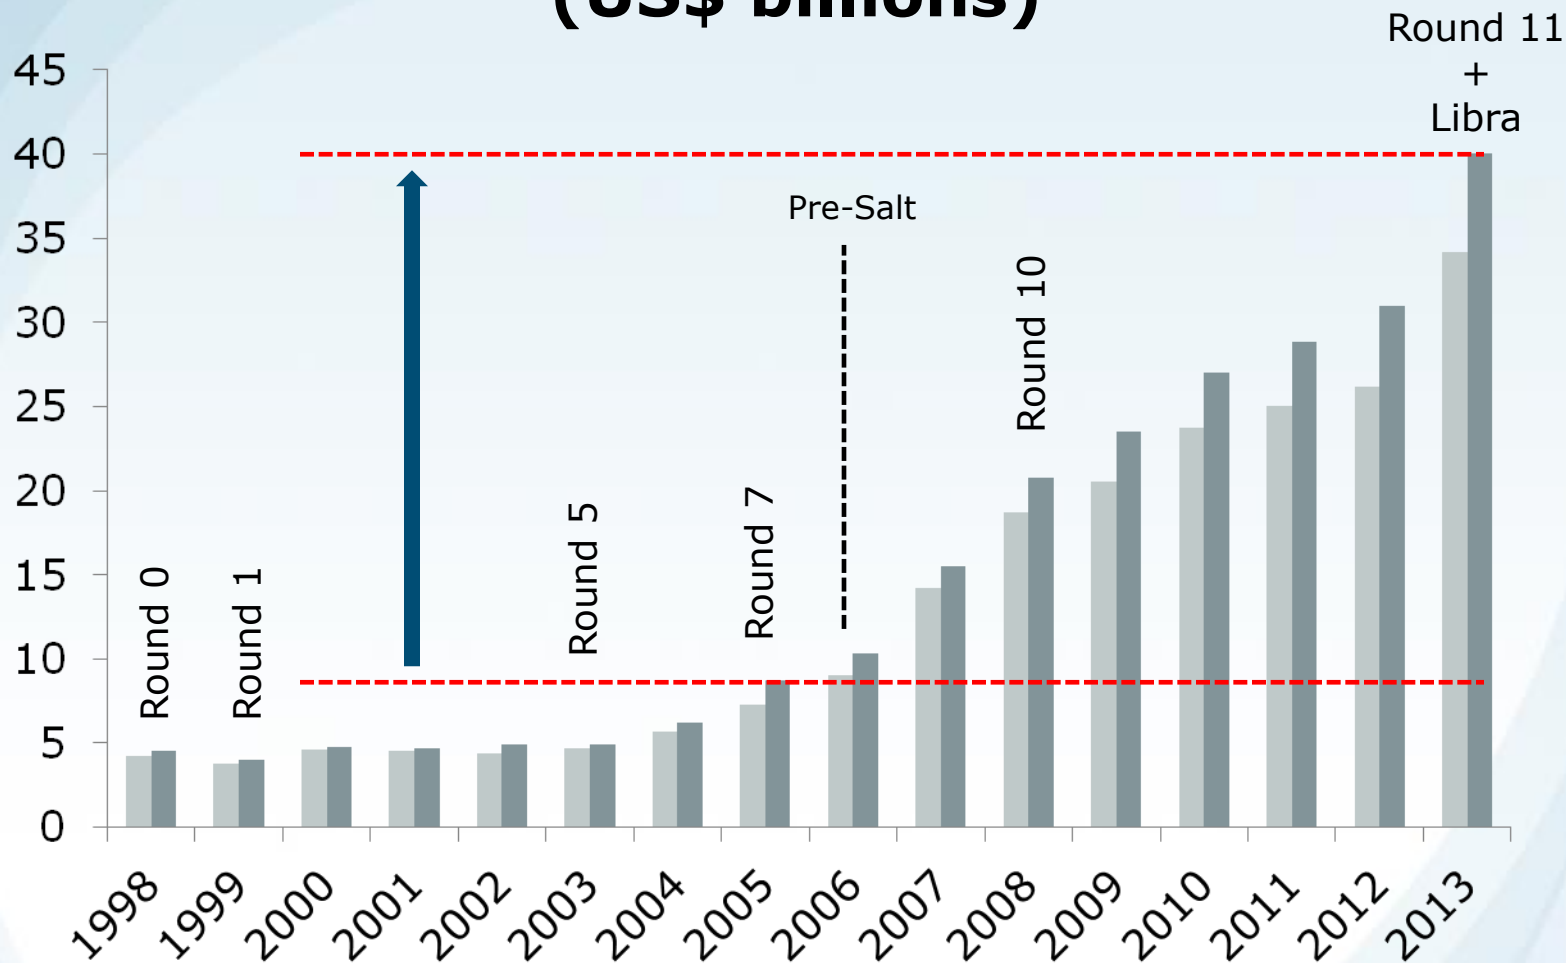

# World Oil Reserves

## Brazil Rank

Proved Reserves (billion barrels)

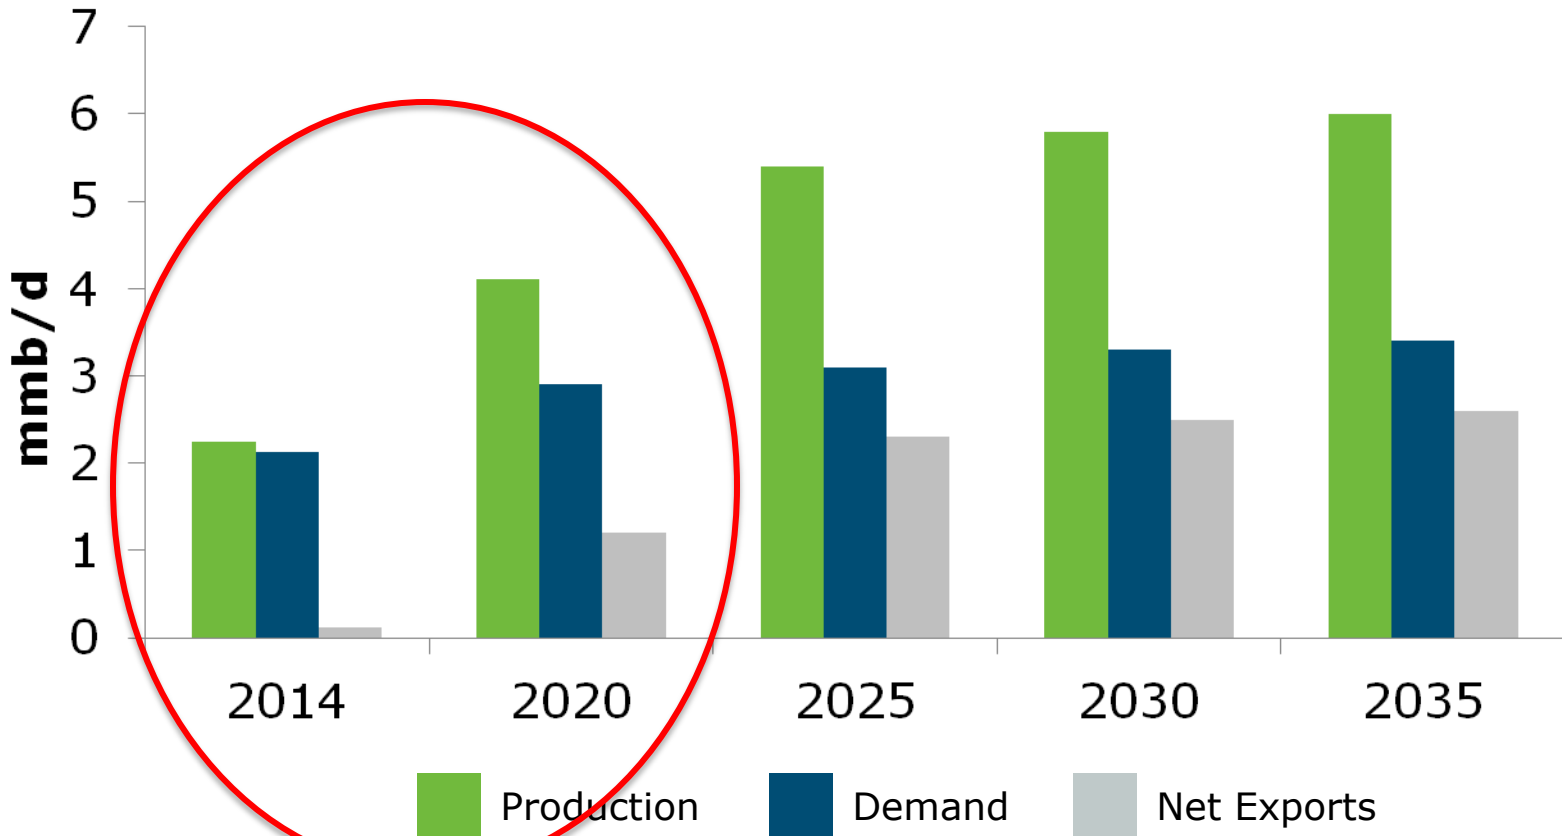

# Annual Investment in E&P (US\$ billions)

# Brazil Oil Production & Demand Forecast

Production, Demand and Brazilian Net Exports  
(million barrels per day)

## 2015-2019 Business and Management Plan (US\$ Billion)

Segments	Capex	%
Exploration & Production*	108.6	83
Downstream**	12.8	10
Gas & Power	6.3	5
Other Areas	2.6	2
<b>Total</b>	<b>130.3</b>	<b>100</b>

\* Includes investment in international business (US\$ 4.9 billion).

\*\* Includes Distribution (US\$ 1.3 billion).

Of total E&P investments, 86% will be allocated to production development, 11% to exploration, and 3% for operational support. New production systems in Brazil will total US\$ 64.4 billion, of which 91% will be for the pre-salt. Exploration activities within Brazil will be concentrated in meeting the Minimum Exploratory Program for each block.

The Downstream segment will receive US\$12.8 billion of investments, of which 69% will be for maintenance and infrastructure, 11% for the conclusion of the Abreu and Lima refinery, and 10% for Distribution. The remaining 10% include investments in Comperj for receiving and treating natural gas, maintenance of equipment, among others.

The Gas & Power area has US\$ 6.3 billion allocated, primarily for the construction of pipelines and processing units to treat gas from the pre-salt

**Oil and NGL Production in Brazil**

**Oil, NGL and Natural Gas Production in Brasil and Abroad**

## **OPPORTUNITIES:**

- Unprecedented opportunities in E&P
- High geological potential in the extraordinary Pré-salt area and also in other sedimentary basins
- E&P investments > US\$ 25 billion/year
- Production will grow from 2 to > 3 million bpd in 2020
- Access acreage through new bid rounds, Petrobras divestment program, and others

## **CHALLENGES:**

To explore the extraordinary geological potential, Brazil has to improve business attractiveness for investors.

### **IBP's Priority Agenda:**

- **Bid Rounds:** *previsibility and regularity*
- **Pre-Salt:** *allow multiple operators*
- **Local Content:** *simplify and reflect market reality*
- **Environmental Licenses:** *improve the process*
- **Fiscal & Regulatory Regime:** *stability and previsibility*

**Government is giving signals on reviewing these critical issues**

## **CHALLENGES (cont.):**

- Current effects of international oil prices + domestic oil sector crisis
- Low oil prices -> lower investments -> cost reduction needs
- “Operação Lava-jato” impacts in the O&G segment
- Regulatory environment uncertainties
- Economic and political crisis

*Passion in building a success story !*

*Paixão na construção de uma história de sucesso!*

# Investment Thesis (2010)

## Team with Proven Track Record

Unmatched combination of institutional relations, technical knowledge and operational experience

## Underexplored/Underdeveloped Potential Resources

Huge potential still remaining in proven basins in both open and contracted acreage, however understanding the geologic play is critical

## Opportunistic Industry Landscape

Contractual stability history, landscape dominated by Petrobras, few well capitalized players

## Multiple, Compelling Exit Opportunities

Recent M&A and IPO activity confirm market interest in Brazilian E&P companies with quality assets and management

# Team with Proven Track Record

Unmatched combination of institutional relations, technical knowledge and operational experience

**João Carlos de Luca, Chairman**

- Former President of IBP (Brazilian Petroleum and Gas Institute)
- Former President of Repsol YPF Brazil
- Former E&P Director and a member of the Board of Directors at Petrobras

**Renato Bertani, Chief Executive Officer**

- Former President of the WPC (World Petroleum Council)
- Former President of Petrobras Americas
- Former Director of Petrobras International

**Cesar Cainelli, Exploration & Production VP**

- Former Worldwide Exploration Manager of Petrobras International with over 30 years
- Extensive experience in deep-water systems in Brazil, West Africa and Gulf of Mexico including the US discoveries of Cascade, Chinook, Hadrian, St. Malo, Stones, and Tiber

**Brian Byrne, CFO & Business Development VP**

- 20 years of experience in the oil and gas industry
- Investment banker covering wide array of E&P companies focusing on mergers & acquisitions and capital raising activity
- Started career at ARCO

# Main Investors

(Capital commitment of US\$ 1.2 billion)

## **First Reserve Corporation**

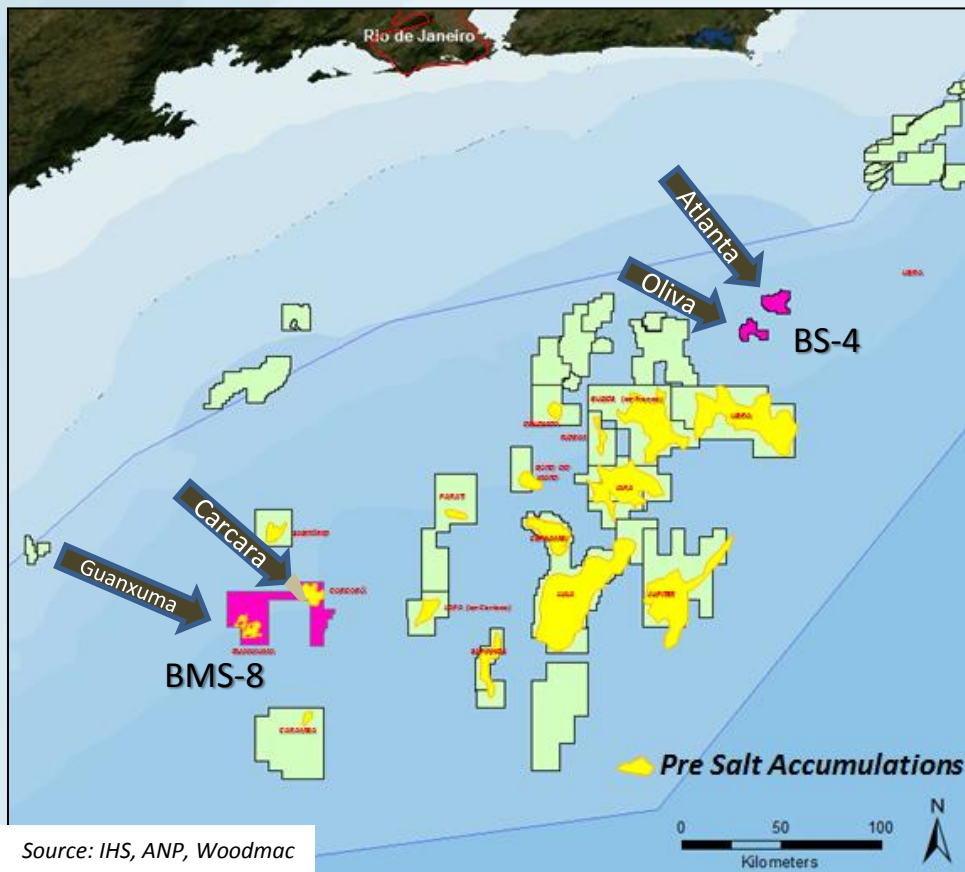

With over US\$ 23 billion of raised capital since inception dedicated exclusively to the energy and natural resources industries, First Reserve is a premier private investment firm, making both private equity and infrastructure investments throughout the energy value chain. For 29 years, it has invested solely in the global energy industry, and has developed a preeminent franchise, utilizing its broad base of specialized energy industry knowledge as a competitive advantage. The firm is currently investing its most recent private equity fund, which closed in 2009 at approximately US\$ 9 billion and its most recent infrastructure fund which closed in 2011 at approximately US\$ 1.2 billion. First Reserve invests strategically across a range of energy industry sectors, backing talented management teams and building value by building companies. Further information is available at [www.firstreserve.com](http://www.firstreserve.com).

## **Riverstone Holdings LLC**

Riverstone Holdings LLC, an energy and power-focused private equity firm founded in 2000, has approximately US\$ 18 billion under management across seven investment funds, including the world's largest renewable energy fund. Riverstone conducts buyout and growth capital investments in the midstream, exploration & production, oilfield services, power and renewable sectors of the energy industry. With offices in New York, London and Houston, the firm has committed approximately US\$ 16.4 billion to 80 investments in North America, Latin America, Europe and Asia. For more information, visit [www.riverstonellc.com](http://www.riverstonellc.com).

## Overview of Barra's Assets

## Summary

- Non operated interest in two ultra deepwater Santos Basin blocks
- Portfolio includes fields under development, discoveries under appraisal and high impact low risk exploration prospects

Block	Working Interest	Acquired From	Acquisition Agreement Reached	Acquisition Approved by ANP
BM-S-8	10%	Shell	Jul '11	Dec '11

# Portfolio Overview

**BM-S-8**

# BM-S-8 Key Assets: Carcará Discovery and Guanxuma Prospects

## Carcará Discovery Well (SPS-86B)

- 402 m of continuous, porous limestone reservoirs with high net-to-gross
- 31o API, no contaminants (CO<sub>2</sub>, H<sub>2</sub>S) recovered throughout the pay zone;
- No oil/water contact, >900m oil column

## Pre-salt Prospectivity

- Guanxuma, Guanxuma NW prospects, geologically similar to Carcará

# CARCARA APPRAISAL PLAN

## Carcará N (SPS-105)

- 352m m of continuous, porous limestone reservoirs with high net-to-gross
- 31o API, no contaminants (CO<sub>2</sub>, H<sub>2</sub>S) recovered throughout the pay zone; identical crude recovered from underlying volcanoclastic layer
- No oil/water contact, consistent with >900m oil column established in discovery well
- Determined reservoir and pressure gradient continuity between Carcará and Carcara N
- DST planned 3Q 2015

## Carcará NW (SPS104DA)

- Drilled to base of salt, drilling through reservoir planned 3Q2015
- DST planned 4Q 2015

# BM-S-8 Carcara Pre Salt Discovery

Carcará NW (proj)

Carcará Well

**Carcará Discovery Well (SPS-86B)**

- Encountered 402m of limestones mostly porous and continuous reservoirs
- Wireline formation tests recovered 31o API oil in various intervals of the sag limestones, free of contaminants
- Evidence that volcanics are also oil bearing
- TD 6,671m, >900m Oil column

5742m – top of pre-salt

6144m - top of rift volcanics

6671m – well TD

# Portfolio Overview

## BS-4

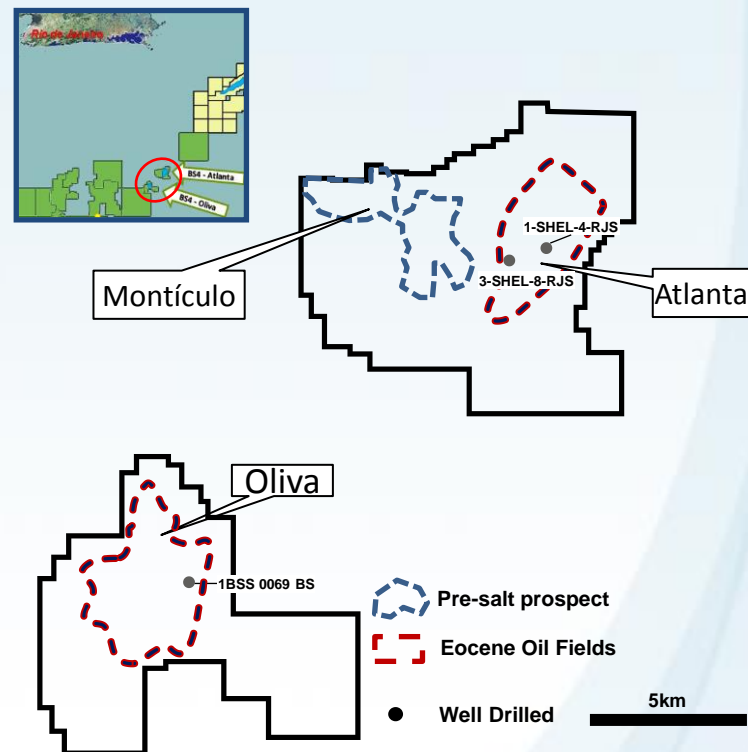

# BS-4: Atlanta and Oliva Fields

## Summary

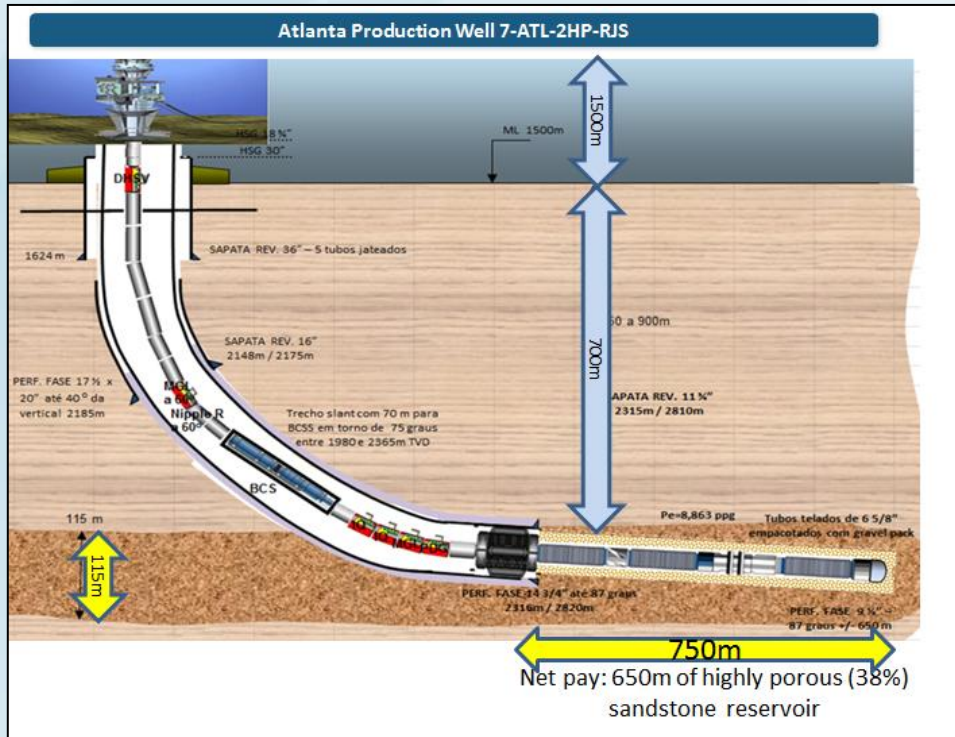

- Two post-salt, heavy oil fields: Atlanta and Oliva
- Recent drilling activity substantially de-risked reservoir flow rates with drilling and testing of two Atlanta horizontal production wells
- Development on track for Mid 2016 first oil
- Total oil in place in excess of 2,100 MMboe, with Atlanta accounting for 80% of the volume
- Pre-salt Montículo low risk prospect, attractive tie back potential to Atlanta
- No local content requirement critical to achieving scheduled timetable

## Atlanta and Oliva Fields

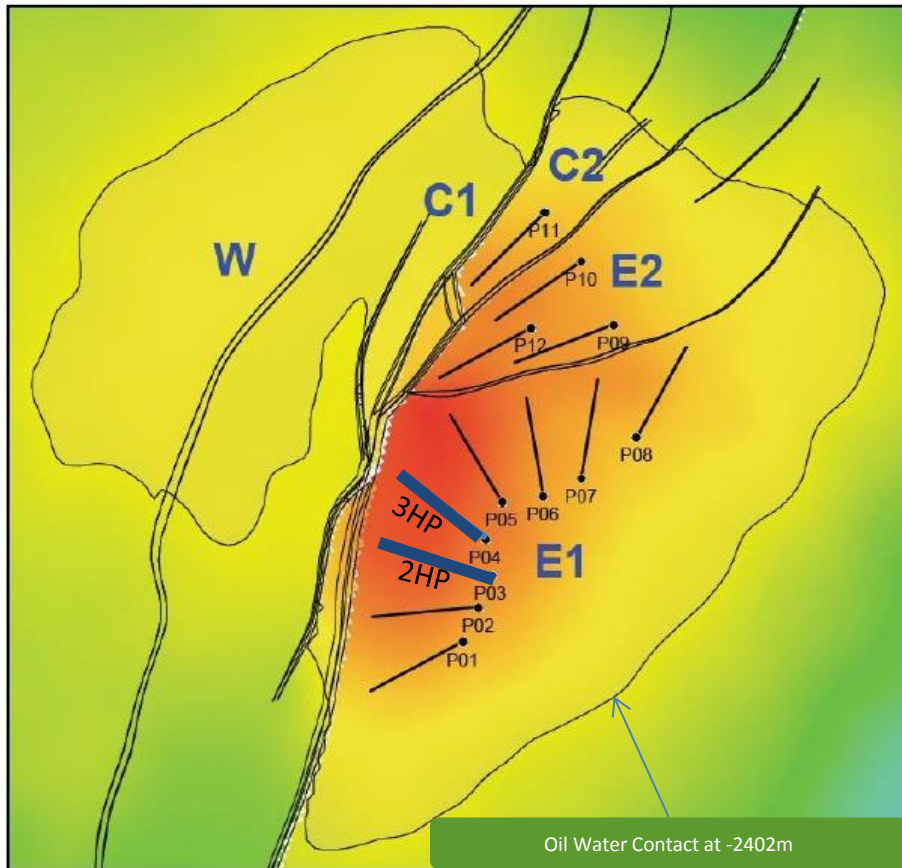

# BS-4 Atlanta Field – Production Well 7-ATL-2HP-RJS

# Atlanta Field Development

## Atlanta Reservoir Drainage Map

Horizontal Production Wells  
Drilled and Completed

- First two production wells indicated ~12k b/day at normal operating condition
- Early Production Phase
  - FPSO contracted, eta Q1 2016
  - One more well planned for 2Q2016
  - First oil: mid 2016 (25k to 30k bopd)
- Full field development
  - 9 additional production wells
  - Peak Production: 80k bopd (2018)

## Seismic Cross Section

# BS-4 OVERVIEW

## Teekay – Petrojarl 1 FPSO

Capping System

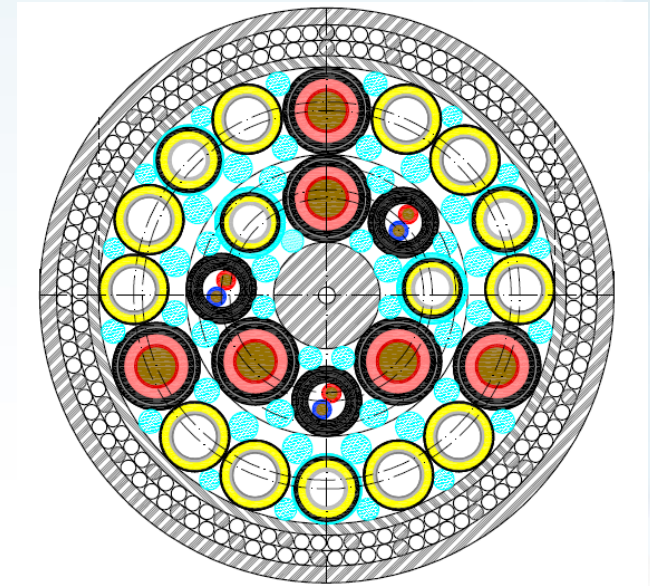

Wet X-Tree

### Flexible line Flowlines and riser

### Umbilicals

● **UTAs (Umbilical Termination Assembly):**

OSR (Oil Spill Response Vessel)

AHTS (Anchor Handler Tug Supply Vessel)

## **In less than two years (2010-2012) Barra Energia could:**

- Attract strong funding commitment (1.2 U\$bn) from industry (leading US energy equity funds, the First Reserve and the Riverstone);
- Establish a strong position in the pre-salt exploration play;
- Reunite a growing skilled team of professionals in all key E&P disciplines;
- Beef up a large data base of seismic (112,000 km 2D and 30,000 km<sup>2</sup> 3D), and well data;

**Barra Energia constructed a diversified portfolio of E&P assets in Santos Basin, one of the most prolific and still under explored oil provinces in the world**

- **Atlanta**: proven reserves under development; first oil → mid 2016
- **Carcará**: world class pre salt accumulation under appraisal; potential for huge productivity and reserves
- Low risk, high impact exploration and development upsides:  
**Guanxuma** pre salt prospect, **Oliva** tie back, Atlanta improved recovery factor, cost rationalization and reduction
- Attractive concession terms
- Team with proven track record

**High ethical and governance standards**

## **BE constructed an attractive business:**

- Balanced and focused portfolio including fields under development, discoveries under appraisal and an inventory of high impact, low risk exploration opportunities
- Operations focused in further de-risking current portfolio
- Well funded to meet current portfolio capex
- Rigorous capital discipline in further portfolio growth

**Thank you!**  
**Obrigado!**
